

Nature and naturalness are becoming more and more precious!

It is our task now to shape our environment so that our children can live in it!

About us...

euratec GmbH is a company that combines products and experience from different areas of agriculture, animal husbandry and plant cultivation.

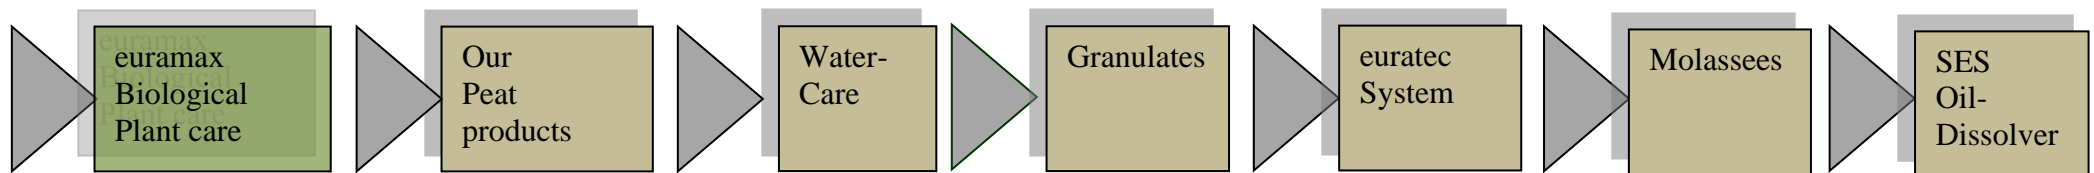

For more than 30 years we have traditionally dealt with natural, highly effective products, trying to keep the amount of chemistry as low as possible. The main focus of the company is intensive research and from this the development of product lines for different areas.

We present:

- **A comprehensive family of products under the registered name euramax for biological plant cultivation and for plant care.**
- **A classic product series for the use of refined peat products.**
- **Another range for research and applications in livestock and agriculture under AGRO SIENCE.**
All products are designed to minimize the impact on humans and the environment.
The application and the mode of action of these products are in many areas almost revolutionary

Specially presented!

BIOLOGICAL PLANT CARE

Plant strengthening

Crop protection

Growth strength

Three top biological products, from our euramax program, which will give you the maximum Care of your favorite plants guaranteed.

valuable parameters. Until recently, the private small farms and users could only guess how it will work with the guaranteed breeding success for them too. - We are now making sure that this changes!

It is our concern at euratec GmbH to also reach the private end customer with the euramax series. - Plants that are grown here for consumption, i.e. enjoyment, return the success of our euromax series directly to you as a customer and consumer through the high quality of the end product. - Growth acceleration at best condition and abundant harvests will convince you.

For garden cultivation, greenhouse use or herb pots on the balcony, the harvest result can be increased up to a yield of 90% compared to conventional products. Healthy plants create joy through good harvest results make us people proud of their own creative work.

For individual floor optimization and also optical design, we have a sensibly coordinated program of goods in our offer.

Natural substances from our modular system:

- Natural clay for mixing into the earthwork, it improves water retention in sandy soils.**
- primary rock powder, a soil additive with minerals from basalt, diabass stone and other types of rocks.**
- Lava stone also as an optical finish on the pot.**
- Precious pumice stones for water retention and as the basis of a root protection layer (hydroponics)**
- Natural zeolites as a cation binder, which stores fertilizers in the soil and passes them on to the root system**
- Peat soils, which regulate pH and provide important humic and fulvic acids to prepare soils with poor microbiology.**
- Organic vegetable carbon production of Terra Preta detoxification and soil improvement**
- Food bacteria (EM - effective microorganisms)**

... and much biological more.

What does the euramax Trio do?

- euramax Active

Root development, growth enhancer in the early phase of the plant, a strong root system guarantees optimal supply

- euramax Gold

Leaf-active fertilizer (spray fertilizer) that brings the purely biological ingredients without detours, directly into the plant and thus achieves the best fertilizing effect.

euramax Protect

confers security against any kind of damage by predatory insects and gives all beneficial insects (bee, bumblebee, butterfly) an intact environment. Dangers from mold are also minimized.

Application recommendation:

euramax Active

Spray seedlings and cuttings with substrate in the root zone when repotting for the first time. The action of Active stimulates microorganisms to increase humus production. Thus, the existing soil quality is significantly improved.

Application rate: Every 7 days, dose 3 ml to 1 l of water and spray.

The plant absorbs the growth stimulator through the foliage and plant stem.

Application should always be done in the morning or evening, preferably under overcast skies, to avoid burning from the sun.

euramax Gold

When the plant is in growth or fruit production, it is useful to pass biological nutrients. Here, too, the conversion by direct spraying is the most effective. The complex nutrients from fruit juices and oils, peptides and amino acids, organic nitrogen, trace elements and other biological ingredients, act through the leaf, stomata and cuticle within 1 - 2 hours. The plant thanks you with the best fruits and flowers, as well as a significantly larger yield of fruits, salads and herbs.

Euramax Gold can of course also be used in addition to MPK fertilizer. The plant absorbs the growth stimulator through the foliage and plant stem. **An application should always take place in the morning or evening, preferably under overcast skies, to avoid burning by the sun.**

Our Tipp: After mixing with water, amino acids cause an unpleasant odor after approx. 24 hours. We recommend mixing only the required amount and rinsing the spray equipment with water after use.

euramax Protect

When the plant is in the growth and flowering phase, it attracts with scents not only pollinators and beneficial insects, but also insects that have negative consequences due to their action. Euramax Protect, through the contained biological plant adjuvants, helps the plant to defend itself against the pests by healthy and vigorous growth. Beneficial insects such as bees, bumblebees and other pollinators find vigorous flowers. - Slugs and snails do not like euramax Protect.

euramax Protect also joins this trio with its mode of action. All active ingredients are completely absorbed through the leaf, stomata and cuticle within 1 - 2 hours. The plant will defend itself against insects and predators (slugs and caterpillars) by optimal formation.

The ingredients are completely harmless to humans and the environment. The adjuvants can be applied with commercially available spraying systems.

Application rate: Every 7 -14 days, 3-4 ml as needed, dose to 1 l of water and spray. Again, the application is always optimal in the morning or evening, at best under cloudy skies, burns from the sun are avoided.
